Introducing two major database resources for exploring and researching language relationships

Paul Heggarty, Max Planck Institute for the Science of Human History, Jena

Abstract

*Sound Comparisons* is an online resource for exploring diversity in phonetics across various language families around the world. At [https://soundcomparisons.com](https://soundcomparisons.com), users can instantaneously compare over 700 language varieties recorded in fieldwork campaigns in Europe, South America and the Pacific. The website includes powerful, linguistically-informed functionality for searching, filtering, citing and downloading all our sound recordings and phonetic transcriptions.

CoR is a new breed of online database for exploring how languages within a family relate to each other in Cognate Relationships in ‘core’ vocabulary. IE-CoR already covers over 150 Indo-European languages, and is tailored to serve both qualitative and quantitative research. I briefly discuss the latest results from Bayesian phylogenetic (‘family tree’) analyses of the IE-CoR data, and what these mean for the controversy over Indo-European origins.
